## <u>Chapter 1</u> <u>Data Modeling using Entity Relatioship (E-R) Diagram</u>

#### **Contents**

- Conceptual Data Model for Database Design
- ER Model Concepts
  - Entities and Attributes
  - Entity Types, Value Sets, and Key Attributes
  - Relationships and Relationship Types
  - Weak Entity Types
  - Roles and Attributes in Relationship Types
- ER Diagrams Notation

#### **Overview of Database**

- Two main activities:
  - Database design
  - Applications design
- Focus in this chapter on database design
  - To design the conceptual schema for a database application
- Applications design focuses on the programs and interfaces that access the database
  - Generally considered part of software engineering

## **Entity-Relationship (ER) Model Concepts**

- A popular high-level conceptual data model
- Entities and Attributes
  - Entities are specific objects or things in the mini-world that are represented in the database.
    - For example the EMPLOYEE John Smith, the Research DEPARTMENT, the ProductX PROJECT
  - Attributes are properties used to describe an entity.
    - For example an EMPLOYEE entity may have the attributes Name, SSN, Address, Gender, BirthDate
  - A specific entity will have a value for each of its attributes.
    - For example a specific employee entity may have Name='John Smith', SSN='123456789', Address ='731, Fondren, Houston, TX', Gender='M', BirthDate='09-JAN-55'
  - Each attribute has a *value set* (or data type) associated with it e.g. integer,

string, subrange, enumerated type, etc

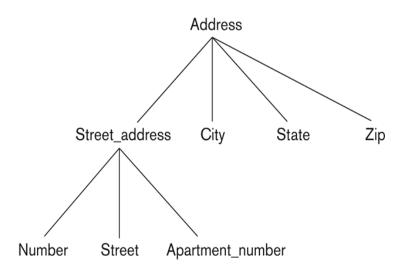

## **Types of Attributes**

- Simple
  - Each entity has a single atomic value for the attribute. For example, SSN or Gender.
- Composite
  - The attribute may be composed of several components. For example:
    - Address(Apt#, House#, Street, City, State,

ZipCode, Country), or

- Name(FirstName, MiddleName, LastName).
- Composition may form a hierarchy where some components are themselves composite.
- Multi-valued
  - An entity may have multiple values for that attribute. For example, Color of a CAR or PreviousDegrees of a STUDENT.
    - Denoted as {Color} or {PreviousDegrees}.

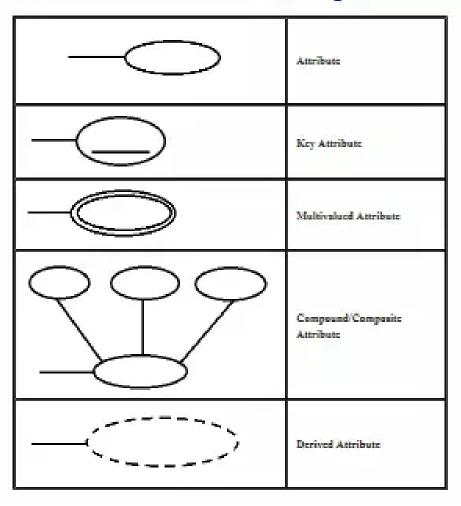

## **Example of a Composite Attribute**

**Figure 3.4** A hierarchy of composite attributes.

- In general, composite and multi-valued attributes may be nested arbitrarily to any number of levels, although this is rare.
  - For example, PreviousDegrees of a STUDENT is a composite multi-valued attribute denoted by {PreviousDegrees (College, Year, Degree, Field)}
  - Multiple PreviousDegrees values can exist
  - Each has four subcomponent attributes:
    - College, Year, Degree, Field
- Complex Attributes
  - Nested composite and multivalued attributes
    - Ex. A person has more than one residence and each residence can have a single address and multiple phones

## Notations Of Attributes in ER Diagram

## **Stored and Derived Attributes**

- An derived attribute is derived from a stored attribute
  - Ex. We can derive a man's age from his birthday.

## Null Values -

Its meaning includes

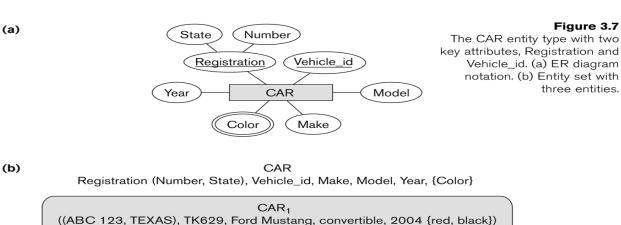

- An attribute value is not applicable
- An attribute value is unknown
  - The value exists but is missing
  - The value is unknown whether it exists

## **Entity Types and Key Attributes**

- Entities with the same basic attributes are grouped or typed into an entity type.
  - For example, the entity type EMPLOYEE and PROJECT.
- An attribute of an entity type for which each entity must have a unique value is called a key attribute of the entity type.
  - For example, SSN of EMPLOYEE.
- A key attribute may be composite.
  - VehicleTagNumber is a key of the CAR entity type with components (Number, State).
- An entity type may have more than one key.
  - The CAR entity type may have two keys:
    - VehicleIdentificationNumber (popularly called VIN)
    - VehicleTagNumber (Number, State), aka license plate number.
- Each key is <u>underlined</u>

## **Displaying an Entity Type**

- In ER diagrams, an entity type is displayed in a rectangular box
- Attributes are displayed in ovals
  - Each attribute is connected to its entity type
  - Components of a composite attribute are connected to the oval representing the composite attribute
  - Derived attributes are denoted by dotted ovals
  - Each key attribute is underlined
  - Multivalued attributes displayed in double ovals
- See CAR example below
- Entity Type CAR with two keys and a corresponding Entity Set

# CAR<sub>1</sub> ((ABC 123, TEXAS), TK629, Ford Mustang, convertible, 2004 {red, black}) CAR<sub>2</sub> ((ABC 123, NEW YORK), WP9872, Nissan Maxima, 4-door, 2005, {blue}) CAR<sub>3</sub> ((VSY 720, TEXAS), TD729, Chrysler LeBaron, 4-door, 2002, {white, blue})

## **Entity Set Value Sets (Domains) of Attributes**

- Each entity type will have a collection of entities stored in the database
  - Called the **entity set** (also called the

extension of the entity type)

• An entity type describes the **schema** or

intension for a set of entities

Previous slide shows three CAR entity

instances in the entity set for CAR

- Same name (CAR) used to refer to both the entity type and the entity set
- Entity set is the current *state* of the entities of that type that are stored in the database
- Each simple attribute is associated with a **value set** (or **domain** of values)
  - Ex. The **Age** attribute of **EMPLOYEE** to be the set of integer numbers

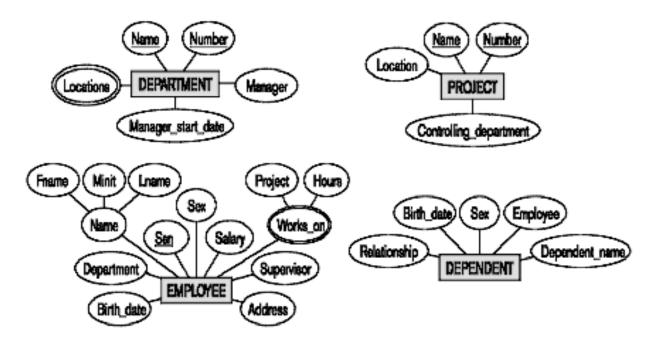

between 16 to 70

## Initial Design of Entity Types for the COMPANY Database Schema

- Based on the requirements, we can identify four initial entity types in the COMPANY database:
  - DEPARTMENT
  - PROJECT
  - EMPLOYEE
  - DEPENDENT
- Their initial design is shown on the following slide
- The initial attributes shown are derived from the requirements description

## **Initial** • **Design of Entity Types:**

EMPLOYEE, DEPARTMENT, PROJECT, DEPENDENT

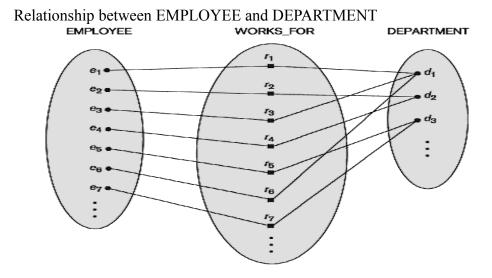

## Refining the Initial Design by Introducing Relationships

- The initial design is typically not complete
- Some aspects in the requirements will be represented as **relationships**
- ER model has three main concepts:
  - Entities (and their entity types and entity sets)
  - Attributes (simple, composite, multivalued)
  - Relationships (and their relationship types and relationship sets)
- We introduce relationship concepts next

## **Relationships and Relationship Types**

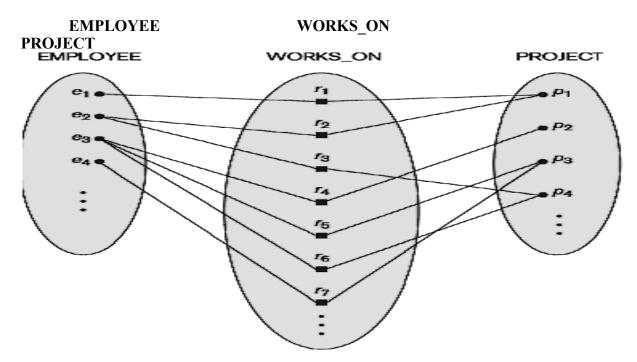

- A **relationship** relates two or more distinct entities with a specific meaning.
  - For example, EMPLOYEE John Smith *works on* the ProductX PROJECT, or EMPLOYEE Franklin Wong *manages* the Research DEPARTMENT.
- Relationships of the same type are grouped or typed into a relationship type.
  - For example, the WORKS\_ON relationship type in which EMPLOYEEs and PROJECTs participate, or the MANAGES relationship type in which EMPLOYEEs and DEPARTMENTs participate.
- The degree of a relationship type is the number of participating entity types.
  - Both MANAGES and WORKS ON are *binary* relationships.

## Relationship Instances of the WORKS\_FOR N:1

## Relationship Instances of the M:N WORKS ON

Relationship between EMPLOYEE and PROJECT

## Relationship Type vs. Relationship Set

- Relationship Type:
  - Is the schema description of a relationship
  - Identifies the relationship name and the participating entity types
  - Also identifies certain relationship

constraints

- Relationship Set:
  - The current set of relationship instances represented in the database
  - The current *state* of a relationship type
- In ER diagrams, we represent the

relationship type as follows:

- Diamond-shaped box is used to display a relationship type
- Connected to the participating entity types via straight lines

## Refining the COMPANY Database Schema by Introducing Relationships

- By examining the requirements, six relationship types are identified
- All are *binary* relationships (degree 2)
- Listed below with their participating entity types:
  - WORKS FOR (between EMPLOYEE,

**DEPARTMENT**)

- MANAGES (also between EMPLOYEE, DEPARTMENT)
- CONTROLS (between DEPARTMENT, PROJECT)
- WORKS ON (between EMPLOYEE, PROJECT)
- SUPERVISION (between EMPLOYEE (as

subordinate), EMPLOYEE (as supervisor))

• DEPENDENTS OF (between EMPLOYEE, DEPENDENT)

## **Discussion on Relationship Types**

- In the refined design, some attributes from the initial entity types are refined into relationships:
  - Manager of DEPARTMENT -> MANAGES
  - Works\_on of EMPLOYEE -> WORKS\_ON
  - Department of EMPLOYEE -> WORKS FOR
  - etc
- In general, more than one relationship type can exist between the same participating entity types
  - MANAGES and WORKS\_FOR are distinct relationship types between EMPLOYEE and DEPARTMENT
  - Different meanings and different relationship instances.
- Each entity type that participates in a relationship type plays a particular **role** in the relationship

## **Recursive** Relationship Type

- A relationship type where the same entity type participates more than once in the relationship in **distinct roles is called recursive relationship**
- Example: the SUPERVISION relationship
- EMPLOYEE participates twice in two distinct roles:
  - supervisor (or boss) role
  - supervisee (or subordinate) role
- Each relationship instance relates two distinct EMPLOYEE entities:
  - One employee in *supervisor* role
  - One employee in *supervisee* role

## Displaying a Recursive Relationship

- In a recursive relationship type.
- Both participations are same entity type in different roles.
  - For example, SUPERVISION relationships between EMPLOYEE (in role of supervisor or boss) and (another) EMPLOYEE (in role of subordinate or worker).
- In following figure, first role participation labeled with 1 and second role participation labeled with 2.
- In ER diagram, need to display role names to distinguish participations.

## A Recursive Relationship Supervision

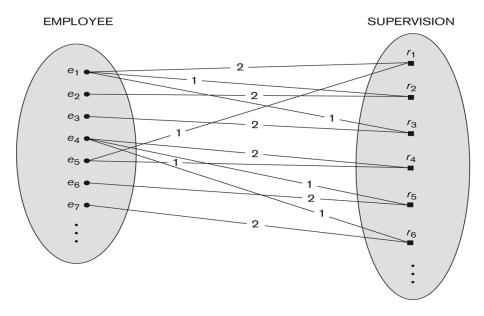

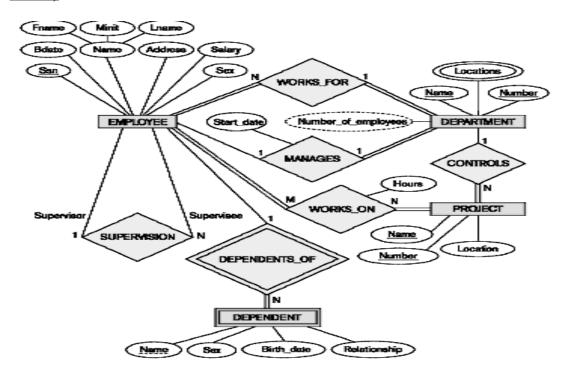

Figure 3.11
A recursive relationship SUPERVISION between EMPLOYEE in the supervisor role (1) and EMPLOYEE in the subordinate role (2).

# <u>Recursive Relationship type is : SUPERVISION (participation role names are shown)</u>

## **Weak Entity Types**

- An entity that does not have a key attribute
- A weak entity must participate in an identifying relationship type with an owner or identifying entity type
- Entities are identified by the combination of:
  - A partial key of the weak entity type

• The particular entity they are related to in the identifying entity type

## • Example:

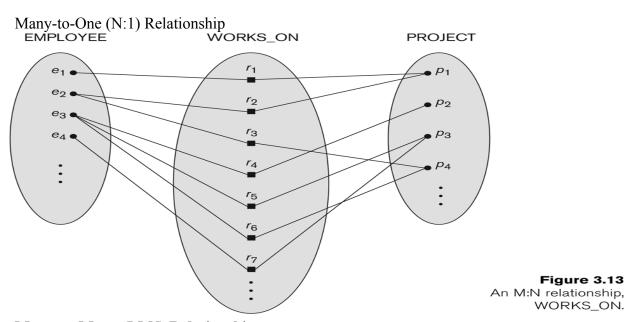

- A DEPENDENT entity is identified by the dependent's first name, *and* the specific EMPLOYEE with whom the dependent is related
- Name of DEPENDENT is the *partial key*
- DEPENDENT is a weak entity type
- EMPLOYEE is its identifying entity type via the identifying relationship type DEPENDENT\_OF
- A week entity type and its identifying relationship are distinguished by surrounding their boxes and diamonds with double lines
- The partial key attribute is underlined with a dashed or dotted line

## **Constraints on Relationships**

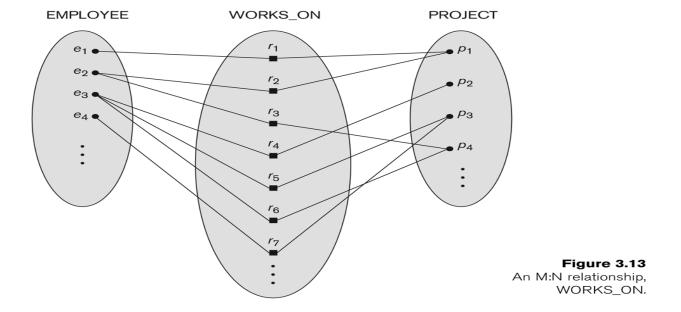

- Constraints on Relationship Types
  - Cardinality Ratio (specifies maximum

participation)

- One-to-one (1:1)
- One-to-many (1:N) or Many-to-one (N:1)
- Many-to-many (M:N)
- Existence Dependency Constraint (specifies *minimum* participation) (also called participation constraint)
  - zero (optional participation, not existence- dependent)
  - one or more (mandatory participation, existence-dependent)

Many-to-Many (M:N) Relationship

## Attributes of Relationship Types

- A relationship type can have attributes:
  - For example, HoursPerWeek of WORKS ON
    - Its value for each relationship instance describes the number of hours per week that an EMPLOYEE works on a PROJECT.
    - A value of HoursPerWeek depends on a

particular (employee, project) combination

- Most relationship attributes are used with M:N relationships
  - For M:N relationships, some attributes are determined by the combination of participating entities, not by a single entity. Such attributes must be specified as relationship attributes
  - In 1:1 relationships, they can be transferred

to one of the participating entities

- In 1:N relationships, they can be transferred to the entity type on the N-side of the relationship
- The decision as to where a relationship attribute should be placed is determined subjectively by the schema designers

# **Example** Attribute of a Relationship Type: Hours of WORKS ON

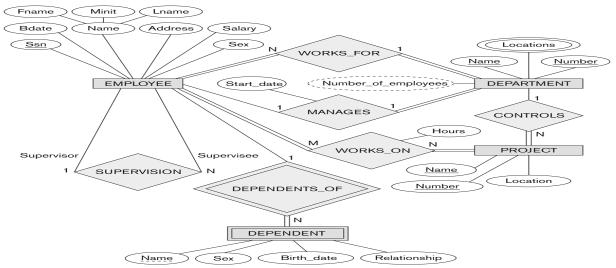

Figure 3.2
An ER schema diagram for the COMPANY database. The diagrammatic notation is introduced gradually throughout this chapter.

### Notation for Constraints on Relationships

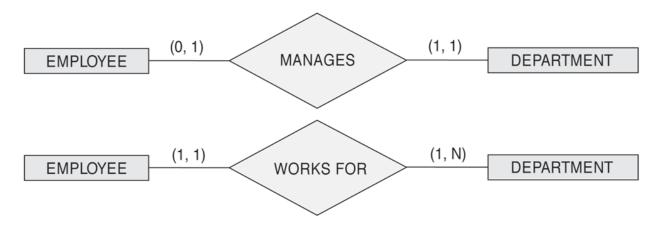

- Cardinality ratio (of a binary relationship): 1:1, 1:N, N:1, or M:N
  - Shown by placing appropriate numbers on the relationship edges.
- Participation constraint (on each participating entity type): **total** (called existence dependency) or **partial**.
  - Total shown by double line, partial by single line.
- NOTE: These are easy to specify for Binary Relationship Types.
- Structural Constraints = Cardinality Ratio Constraints + Participation Constraints

## Alternative (min, max) Notation for Relationship Structural Constraints

- Specified on each participation of an entity type E in a relationship type R
- Specifies that each entity e in E participates in at least *min* and at most *max* relationship instances in R

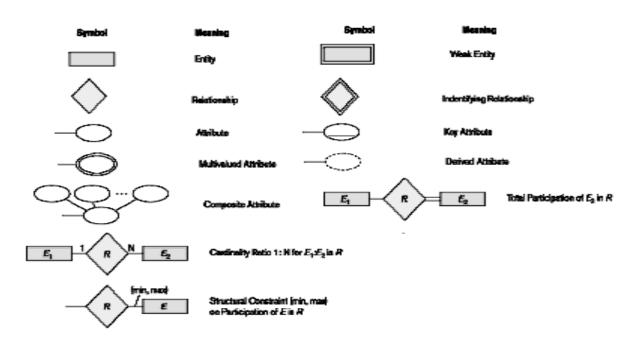

- Default (no constraint): min=0, max=n (signifying no limit)
- Must have min $\leq$ max, min $\geq$ 0, max  $\geq$ 1
  - min=0 implies partial participation; min>0 implies total participation
- Derived from the knowledge of mini-world constraints
- Examples:
  - A department has exactly one manager and an employee can manage at most one department.
    - Specify (1,1) for participation of DEPARTMENT in MANAGES
    - Specify (0,1) for participation of EMPLOYEE in MANAGES
  - An employee can work for exactly one department but a department can have any number of employees.
    - Specify (1,1) for participation of EMPLOYEE in WORKS\_FOR
    - Specify (1,n) for participation of DEPARTMENT in WORKS\_FOR

### The (min,max) Notation for Relationship Constraints

• Read the min, max numbers next to the entity type and looking away from the entity type

## **Summary of Notation for ER Diagrams**

## **COMPANY ER Schema Diagram Using (min, max) Notation**
